Crop Stage (CS) highlighted in **bold** is the dominant stage during the month of April

Rice CS:
(I) Nursery
(II) Vegetative
(III) Reproductive
(IV) Flowering

Corn CS:
(I) Establishment
(II) Vegetative
(III) Siling
(IV) Reproductive

CCI Category:
Inadequate
Sufficient
Excess

Regional Summary

Most provinces in MIMAROPA region received insufficient amount of rainfall during the month, except for the province of Marinduque which received adequate amount of rainfall for corn crops, but inadequate for the rice crops to support the pre-planting activities.

According to the 3-month accumulated rainfall map, near normal conditions are experienced over most parts of the region, with above normal (wetter) conditions over the island provinces of Marinduque and Romblon, with the exception of several regions in Occidental and Oriental Mindoro, the NDVI indicates good vegetation.

Despite the impacts of TD Amang, the maximum 1-day and 5-day accumulated rainfall show that only a maximum of 150mm was received on the eastern sections and may have favorable effects on the pre-planting activities over the farm areas in the region.
