Harvesting and/or
pre-planting
stage is possibly
ongoing.

Water Availability for Corn
Prevailing Stage : None

Harvesting and/or
pre-planting
stage is possibly
ongoing.

Crop Stage (CS) highlighted in 0.000 is the dominant stage during the month of April

Rice CS:
(I) Nursery
(II) Vegetative
(III) Reproductive
(IV) Ripening

Corn CS:
(I) Establishment
(II) Vegetative
(III) Reproductive
(IV) Maturity

CCI Category:
Inadequate
Sufficient
Excess

Regional Summary

The prevailing farm activities during the month is harvesting and/or pre-planting. For existing farm crops over most of the provinces, rainfall is likely excessive due to the influence of the Intertropical Convergence Zone (ITCZ) and a Low-Pressure Area (LPA) that formed in the proximity of Southern Mindanao. Nevertheless, the rainfall received over Zamboanga del Norte and Zamboanga del Sur may just be sufficient for possible existing crops under the earlier cropping stages.

The past three months have brought near to slightly above normal rainfall over the Zamboanga Peninsula. The daily maximum rainfall reached 50-100mm over most areas, with consecutive days of rainfall reaching a cumulative amount of 200-250mm at the southern portion of Zamboanga Sibugay and at its boundary with Zamboanga del Norte and Zamboanga City.
