		III	171.3	III	174.5
		IV	190.9	IV	188.8

Crop Stage (CS) highlighted in black is the dominant stage during the month of August

Rice CS: (I) Nursery (II) Vegetative (III) Reproductive (IV) Ripening
 Corn CS: (I) Establishment (II) Vegetative (III) Reproductive (IV) Maturity
 CCI Category: Inadequate (Yellow), Sufficient (Green), Excess (Blue)

Regional Summary

The Bicol region generally received sufficient amount of rainfall which was favorable for both rice and corn crops, especially the rice crops at the prevailing reproductive stage and corn crops at the prevailing maturity stage.

The SPEI3 suggests generally near normal conditions in most parts of the region except for some areas in Masbate, Albay, and Sorsogon where slightly wetter than normal conditions were experienced. This amount might have potential impact on both standing rice and corn crops in these areas. In addition, the extreme rainfall indices show notable rainfall that could affect both rice and corn crops in some of the areas at the eastern part of the region with estimated maximum 1-day and maximum 5-day rainfall of about 50-150mm. This could be mainly attributed to the LPA near the region during the last day/s of the month.
