Crop Stage (CS) highlighted in **black** to the dominant stage during the month of August.

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
 Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity
 CCI Category: Inadequate (yellow), Sufficient (green), Excess (blue)

Regional Summary

Rainfall received for the month was sufficient for both rice and corn crops at any crop stage in Antique province. Such amount was also experienced in Iloilo province and Negros Occidental for their respective prevailing stages, ripening and maturity stage, respectively. Meanwhile, excessive rainfall amount could have caused potential damage on both rice and corn crops in Aklan, Capiz, and Guimaras.

The SPEI3 indicates slightly wetter than normal conditions in most parts of Aklan, Capiz, and Iloilo, while generally near normal for the rest of the region. The RX1day and RX5day indicates maximum 1-day and 5-day rainfall of 50-150mm and 100-200mm, respectively, which may have brought potential damage on both rice and corn crops in Capiz and Aklan. This extreme rainfall was mainly attributed to the LPA during the end of the month.
