Crop Stage (CS) highlighted in BLACK is the dominant stage during the month of December

Rice CS:
(I) Nursery
(II) Vegetative
(III) Reproductive
(IV) Ripening

Corn CS:
(I) Establishment
(II) Vegetative
(III) Reproductive
(IV) Maturity

CCI Category:
Inadequate
Sufficient
Excess

Regional Summary

The rainfall for the month was excessive for the month which might have caused potential damage to both rice and corn crops at any of the crop stages in Marinduque, Palawan, and Romblon. Meanwhile, the rainfall for the month was sufficient to support both rice and corn crops, particularly, rice crops at the prevailing nursery and corn crops at the prevailing reproductive stage in Occidental and Oriental Mindoro.

The NDVI indicates generally healthy vegetation for the month in most farm areas of the region. The SPEI3 shows slightly wetter than normal conditions in most parts of Marinduque and Romblon, and slightly drier than normal in southern part of Palawan, while generally near normal conditions in the rest of the region. The one-day and cumulative five-day rainfall are notably high, which is mostly attributed to the influence of TD Querubin.
