

Cordillera Administrative Region

Water Availability for Rice
Prevailing Stage : (II) Vegetative

Water Availability for Corn
Prevailing Stage : None

Harvesting and/or pre-planting stage is possibly ongoing.

Crop Stage (CS) highlighted in **bold** is the dominant stage during the month of February.

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity
CCI Category: Inadequate (Yellow), Sufficient (Green), Excess (Blue)

Regional Summary

The rainfall in the Cordillera Administrative Region (CAR) was inadequate for all rice crop stages, particularly during the prevailing Vegetative stage.

Rainfall had been relatively moderate over the eastern portion of the Region which occurred in RX1day (50-150mm) and RX5day (50-200mm) and most likely influenced by the Northeast Monsoon and shear line in the past few weeks of the month.

Despite the minimal rainfall amount in the entire Region, the accumulated moisture in the past 3-months (see SPEI3) had been slightly above normal, signifying the possibility of sufficient water availability for the crops subject to the existence of an irrigation system.

NDVI

NDVI satellite data not yet available.
