## Regional Summary

Rainfall in the entire Ilocos Region was inadequate for the rice crops during their Vegetative stage. Light rain was experienced in the middle of the month based on the maximum RX1day (50-100mm) and maximum RX5day (50-100mm) which may have stunted crop growth.

Despite the minimal rainfall amount in the Region during the entire month, the accumulated moisture in the past 3-months (see SPEI3) had been slightly above normal, signifying the possibility of sufficient water availability for the crops subject to the existence of an irrigation system.
