

Region IV-B (MIMAROPA)

Water Availability for Rice
Prevailing Stage : (III) Reproductive

Water Availability for Corn
Prevailing Stage : None

Harvesting and/or pre-planting stage is possibly ongoing.

Provincial Values

	Mon. Ave. Rainfall (mm)	Rice		Corn	
		CS	CCI (%)	CS	CCI (%)

Crop Stage (CS) highlighted in **bold** is the dominant stage during the month of February

Rice CS:
(I) Nursery
(II) Vegetative
(III) Reproductive
(IV) Ripening

Corn CS:
(I) Establishment
(II) Vegetative
(III) Reproductive
(IV) Maturity

CCI Category:
 Inadequate
 Sufficient
 Excess

Regional Summary

Rainfall was sufficient for the rice crops over Marinduque, Oriental Mindoro, and Romblon, particularly those in the prevailing Reproductive stage. The corn crops over Occidental Mindoro and Oriental Mindoro benefited from sufficient rainfall, although it is likely that farms over those areas are currently on their pre-planting or harvesting phase. Meanwhile, the rice crops over parts of Occidental Mindoro may have suffered from water stress due to inadequate rainfall. Excess rainfall may have adversely affected the rice crops over Palawan and the corn crops over Marinduque, Palawan and Romblon.

In the past three (3) months, the southernmost part of Palawan likely suffered from dry conditions due to the below normal rainfall over that area. Meanwhile, it received a large rainfall amount from consecutive days of heavy rainfall (reaching a total 400mm) which is attributed to the shear line and NE monsoon. Such extreme conditions are detrimental to the development of existing crops in said area.
