Excess

## Regional Summary

Rainfall in Zamboanga Peninsula was too excessive to support the rice and corn crops in all their stages over the Region; this may be favorable during the pre-planting and/or harvesting season, but it might be harmful to standing crops such as corn crops prevailing in the Maturity stage.

SPEI3 indicates near-normal to slightly below-normal rainfall conditions for the past three months. Based on the RX5day, consecutive days of significant rainfall (50-150 mm) may have caused potential damage to standing crops over some parts of Zamboanga del Norte and Zamboanga Sibugay. These were mainly brought by the effects of weather systems such as the Intertropical Convergence Zone (ITCZ), easterlies, localized thunderstorms, and shear line throughout the month.
