Crop Stage (CS) highlighted in black is the dominant stage during the month of February

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
 Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity
 CCI Category: Inadequate (yellow), Sufficient (green), Excess (blue)

Regional Summary

The rainfall for the month was sufficient for rice crops at any crop stage as well as for corn crops, especially the corn crops at the prevailing Reproductive stage in Aklan, Capiz, Iloilo, and Negros Occidental. However, inadequate rainfall might have caused potential harm on rice crops at any stage and corn crops at the prevailing Reproductive stage in Antique and Guimaras.

The SPEI3 suggests generally near normal condition experienced for the past three months in most parts of the Region. The extreme rainfall indices (i.e. RX1day and RX5day) show significant rainfall which could have caused potential damage on both rice and corn crops in northern portions of Aklan, Capiz, and Iloilo. This was mainly attributed to the rainfall from the Northeast Monsoon, shear line, and localized thunderstorms during the first week of the month.
