Crop Stage (CS) highlighted in black to the dominant stage during the month of January

Rice CS: (I) Nursery (II) Vegetative (III) Reproductive (IV) Ripening  
Corn CS: (I) Establishment (II) Vegetative (III) Reproductive (IV) Maturity  
CCI Category: Inadequate (Yellow), Sufficient (Green), Excess (Blue)

## Regional Summary

Most of the rice crops in the region were in the harvesting stages. Rainfall received for the month was inadequate for corn crops, particularly the corn crops at the prevailing reproductive stage in most parts of all the provinces in Zamboanga Peninsula.

According to the SPEI3 map, slightly drier than the average conditions were experienced in most parts of Isabela, Zamboanga del Sur, and western portion of the region. While the rest of the region was near normal. There was no significant extreme rainfall that might have caused harm on rice or corn crops in the region based on the extreme rainfall indices. In general, crops are in good condition in the region as shown in the NDVI map.
