Crop Stage (CS) highlighted in **bold** is the dominant stage during the month of January.

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
 Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity

CCI Category: Inadequate (Yellow), Sufficient (Green), Excess (Blue)

Regional Summary

The rainfall was sufficient for rice crops at any stage in Marinduque, Oriental Mindoro, and Palawan. Rainfall was likewise sufficient for corn crops at any stage in Oriental Mindoro and Palawan. Inadequate rainfall for the month could have caused potential harm on both rice and corn crops at any of the crop stage in Occidental Mindoro. Excessive rainfall for the month could have caused potential damage on both rice and corn crops at any stage in Romblon, and corn crops at any stage in Marinduque.

The NDVI shows generally healthy vegetation in most of the farm areas in the region, except in some area in the southern portion of Occidental Mindoro, with possibly slightly stressed crops. The SPEI3 suggests generally slightly above normal condition experienced for the region, except in Romblon where wetter than normal condition was experienced. The extreme rainfall indices indicate notable rainfall that might have caused potential damage on both rice and corn crops at Romblon, Marinduque, Southern portion of Palawan, and northern parts of Oriental Mindoro. These events are likely attributed to the Shearline.
