## Regional Summary

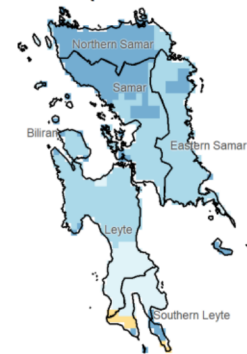

Generally, farmlands throughout the Eastern Visayas accumulated an excessive rainfall, which may have been detrimental to standing rice crops, yet advantageous prior to pre-planting and/or harvesting season. The notable amount of rain is likely attributed to the combined effects of the Shearline and Northeast Monsoon. Nevertheless, there is no indication of crop damage as per NDVI image.

The accumulated rainfall for the past three months (SPEI3) was suggested to be slightly above normal to above normal in the central and northern part of the Region. Moreover, slightly wetter conditions were observed in Northern Samar, Samar, and portions in Eastern Samar. The RX1day and RX5day recorded significant amount of rainfall (200-400mm). Such amount may have been caused by the shear line during the first and last week of the month.
