

# Cordillera Administrative Region

Water Availability for Rice  
Prevailing Stage : (III) Reproductive

Water Availability for Corn  
Prevailing Stage : None

Harvesting and/or  
pre-planting  
stage is possibly  
ongoing.

Crop Stage (CS) highlighted in black is the dominant stage during the month of March

Rice CS:  
(I) Nursery  
(II) Vegetative  
(III) Reproductive  
(IV) Ripening

Corn CS:  
(I) Establishment  
(II) Vegetative  
(III) Reproductive  
(IV) Maturity

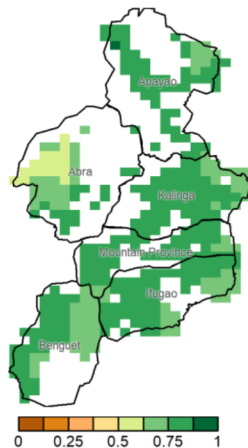

CCI Category:  
Inadequate  
Sufficient  
Excess

## Regional Summary

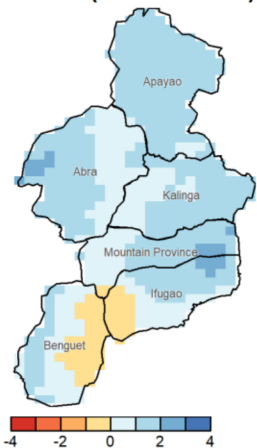

Farm areas in the Region had inadequate water supply throughout the month. The insufficiency of water supply could have a negative impact on the Reproductive stage of rice crops in the area, potentially leading to a decrease in yield without an irrigation system. For corn crops, while such conditions are advantageous for the harvesting season, water supply will be in demand for the pre-planting season, thereby hindering the planting activities in the area.

Despite the minimal rainfall, the Region for the past three months has still been in wetter conditions, except in some areas in Benguet and Ifugao.
