Crop Stage (CS) highlighted in **bold** is the dominant stage during the month of March

Rice CS:
(I) Nursery
(II) Vegetative
(III) Reproductive
(IV) Ripening

Corn CS:
(I) Establishment
(II) Vegetative
(III) Reproductive
(IV) Maturity

CCI Category:
Inadequate
Sufficient
Excess

Regional Summary

Rainfall was sufficient for the rice crops over Marinduque, Palawan and Romblon, particularly those in the prevailing Reproductive to Ripening stage. While Occidental and Oriental Mindoro received insufficient rainfall which is beneficial during their Ripening to harvesting stage.

NDVI in Occidental and Oriental Mindoro shows most of the crops are slightly stressed while other crops in the Region are healthy.

Rainfall in the past three (3) months shows near to above normal level, which signifies that the current prevailing crops most likely had sufficient rainfall and the crops are in good and healthy condition.

The RX1day showed maximum rainfall from 50 to 100 mm and RX5day indicated maximum consecutive rainfall is from 50 to 200 mm of rainfall. This amount of rainfall gives the crop a good condition during the month.
