Crop Stage (CS) highlighted in **black** to the dominant stage during the month of May

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity
CCI Category: Inadequate (Yellow), Sufficient (Green), Excess (Blue)

Regional Summary

Except for Mountain Province, the rainfall received for the month was sufficient to support the corn crops at the prevailing vegetative stage in the region. Meanwhile, Mountain Province received excessive rainfall for the corn crops which could have caused negative impacts to the crops. NDVI map indicated that the vegetation in the region is generally in fair condition.

SPEI3 map indicated experienced near-normal to slightly drier conditions for the past three-month accumulated rainfall. The extreme rainfall indices (RX1day and RX5day) observed extreme rainfall amounts of about 100 to 250 mm respectively. This may be attributed to the combined influence of localized thunderstorms and shearline affecting northern Luzon during the 2nd week of the month, also the enhancement of southwest monsoon contributed by the tropical cyclone "Aghon" during 4th week of the month.
