Crop Stage (CS) highlighted in **blue** is the dominant stage during the month of May

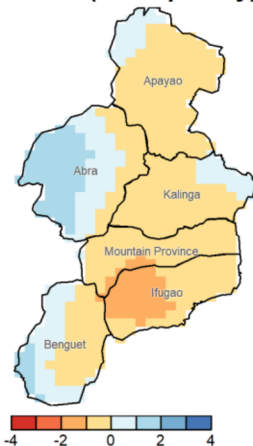

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity
CCI Category: Inadequate (yellow), Sufficient (green), Excess (blue)

Regional Summary

Generally, the rainfall received during the month was excessive for both rice and corn crops. Meanwhile, rainfall was sufficient in Apayao, Ifugao and Kalinga province for the corn crops in the prevailing vegetative stage, and for the harvesting and/or pre-planting activities for rice crops.

The SPEI3 suggests near-normal condition throughout the region, except for a small portion of Mountain province and Ifugao where slightly drier conditions were likely. Furthermore, the RX1day and RX5day indices denote a range of about 50–150 mm and 150–350 mm, respectively. The maximum rainfall occurred over provinces of Apayao, portions of Abra, and Benguet, which can be attributed to the presence of the Frontal system and Southwesterly Windflow/ Southwest Monsoon.
