		IV	160.5	IV	172.9

Crop Stage (CS) highlighted in bold to the dominant stage during the month of May

Regional Summary

Throughout the month, majority of the farm areas in the region had a sufficient water supply for rice and corn crops. This was due to the favorable weather conditions, which brought maximum rains ranging from 50 to 200 mm, resulting in a wetter condition as seen in the SPEI3 map. These favorable conditions are beneficial for the upcoming planting season for rice and for the growth and development of the prevailing vegetative stage of corn crops in the area. If these favorable conditions continue (together with other factors) for the succeeding months, crops in the region may potentially bring good production and yield.
