Crop Stage (CS) highlighted in black is the dominant stage during the month of November

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
 Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity

CCI Category: Inadequate (Orange), Sufficient (Green), Excess (Blue)

Regional Summary

The rice and corn crops of the region for the month were in the vegetative and maturity phase respectively. These prevailing cropping stages of both crops in the region received sufficient amount of rainfall except for farm areas in Biliran province where inadequate water supply for rice crops was observed.

Furthermore, the drought indicator (SPEI3) illustrates a generally wetter condition in the region except for Southern Leyte where drier condition for the past three-month was observed. The extreme rainfall indices maps, on the other hand, shows that the maximum five and one-day rainfall was ranging from 50 to 150 millimeters. Notable rainfall of the month was experienced in the third and fourth week of the month. This rainfall was contributed to super typhoon Pepito, which passed in the eastern coastal waters of the region, and ITCZ in the area.
