(I) Nursery
(II) Vegetative
(III) Reproductive
(IV) Ripening

Corn CS:
(I) Establishment
(II) Vegetative
(III) Reproductive
(IV) Maturity

CCI Category:
Inadequate
Sufficient
Excess

Regional Summary

During October, Maguindanao province received sufficient amount of rainfall to support rice crops at the prevailing nursery stage but excessive for corn crops at all cropping stages. Lanao Del Sur received excessive water supply for both crops during the month. Moreover, inadequate rainfall amount was observed for rice and corn crops in their respective prevailing stages which may have adverse effects and may lead to crop stress over farm areas in Basilan, Sulu, and Tawi-Tawi provinces.

Meanwhile, the NDVI indicated that the crop conditions in the farm areas were generally fair. The SPEI3 indicated that the region was generally in near normal condition, with the exception of the Basilan, Sulu, and Tawi-Tawi province where slightly drier conditions were observed. The ranges given by the RX1day and RX5day indices are around 50-100mm showing that no significant extreme rainfall events have occurred in the region.
