Crop Stage (CS) highlighted in black is the dominant stage during the month of October

Rice CS: (I) Nursery (II) Vegetative (III) Reproductive (IV) Ripening

Corn CS: (I) Establishment (II) Vegetative (III) Reproductive (IV) Maturity

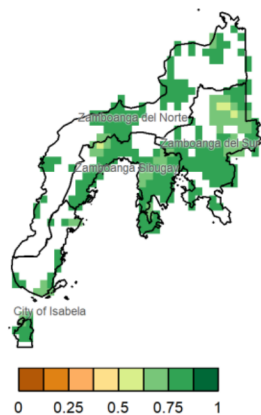

CCI Category: Inadequate Sufficient Excess

Regional Summary

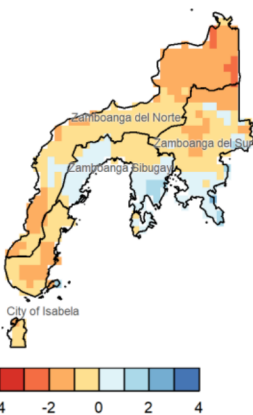

Except for the City of Isabela, which received inadequate amount of rainfall to support the rice and corn crops, most provinces in the Zamboanga Peninsula received sufficient amount of rainfall for both rice and corn crops, specially those at the prevailing vegetative stage and reproductive stage respectively. SPEI3 map indicate that the region was generally in near-normal condition for the past three months, with relatively drier conditions mainly in the northeastern part of Zamboanga del Norte. Moreover, slightly wetter condition was observed in the southeastern part of Zamboanga Sibugay.

Meanwhile, the RX1day and RX5day have shown that the northeastern part of Zamboanga del Norte might have experienced a heavy rainfall event due to reaching to about 100 to 250 mm, due to the combined influences of southwest monsoon and localized thunderstorms. Such amount may have been advantageous for standing corn crops. NDVI indicated good crop conditions.
