Regional Summary

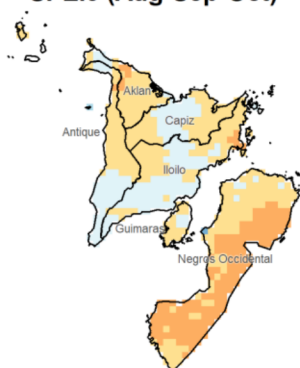

In general, most parts of the region received sufficient amount of rainfall which may be beneficial for pre-planting activities for rice crops and for the prevailing reproductive stage of corn crops.

Based on the three-month accumulated rainfall as shown in the SPEI3 map, majority of the provinces in the Western Visayas region experienced near-normal condition, except for the slightly drier condition in most parts of Negros Occidental and in minor parts of Aklan and Iloilo. Although no notable extreme rainfall event was observed, the maximum 5-day rainfall (RX5day) ranging from 150-200 mm over some areas of Iloilo and Negros Occidental could be attributed to the influence of localized thunderstorms over the region. NDVI indicated generally good crop condition.
