		II	131.7	II	188.0
		III	126.8	III	147.1
		IV	126.8	IV	185.8

Crop Stage (CS) highlighted in **black** is the dominant stage during the month of September

Rice CS: (I) Nursery, (II) Vegetative, (III) Reproductive, (IV) Ripening
 Corn CS: (I) Establishment, (II) Vegetative, (III) Reproductive, (IV) Maturity
 CCI Category: Inadequate (yellow), Sufficient (green), Excess (blue)

Regional Summary

A sufficient amount of rainfall fell across most of the Bicol region, which was beneficial for the development of crops, particularly those at the ripening stage of rice crop and expected harvesting and/or pre-planting stage of corn crops.

According to the 3-month accumulated rainfall as shown in the SPEI3, most of the provinces in the Bicol region experienced near-normal conditions except for the observed slightly drier conditions in some portions of Albay, Camarines Norte, and some parts of Catanduanes provinces. However, significant rainfall indicated by the extreme rainfall indices may have an impact on rice and corn harvests in certain locations in the northern and southeastern parts of the region, with estimated maximum 1-day and maximum 5-day rainfall of about 50-250mm. This may be primarily due to the influence of the following atmospheric systems: severe localized thunderstorms, and Tropical Depression (TD) "Enteng" during the beginning of the week.
