Regional Summary

The entire Ilocos Region received inadequate rainfall to support rice and corn crops in all crop stages. This amount may contribute to a slight decrease in crop production for this month.

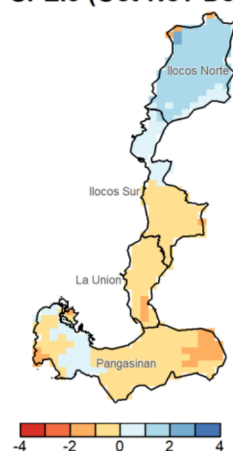

The Rx1day and Rx5day indexes indicated that no heavy rainfall affected the crops. In terms of three-month accumulated rainfall, near-normal to slightly drier condition was observed in the southern part of Ilocos region. On the other hand, near-normal to slightly wetter conditions were observed in the northern areas of the region due to the possible influence of the shear line and northeast monsoon.

The slightly lower vegetation (NDVI) might have been due to the influence of lower observed rainfall during this month.
