Crop Stage (CS) highlighted in black to the dominant stage during the month of September

Rice CS: (I) Nursery (II) Vegetative (III) Reproductive (IV) Ripening

Corn CS: (I) Establishment (II) Vegetative (III) Reproductive (IV) Maturity

CCI Category: Inadequate Sufficient Excess

Regional Summary

Most rice and corn farm areas are in the harvesting and pre-planting stages. The rainfall received for the month could be advantageous for the harvesting of rice and corn crops but insufficient for the pre-planting activities of rice crops in the region.

The region generally experiences normal to slightly wetter conditions based on the three-month Standardized Precipitation Evapotranspiration Index (SPEI3) map, particularly in certain areas of Compostela Valley and Davao Oriental. On the other hand, there has been no significant 1-day heavy rainfall in the region based on the extreme rainfall index RX1day, while the RX5day (5-day extreme rainfall) indicates rainfall ranging from 50 to 150 mm, which may be caused by various weather systems affecting the region such as the southwest monsoon, trough of tropical cyclone, Intertropical Convergence Zone (ITCZ), and isolated thunderstorms.
